

# BRAKING SYSTEM INSTRUCTIONS

## BEFORE USING YOUR STEP...

It is important to always check that the step is used on an even surface and that the legs are fully grounded before ascending, there should be no damage to the step treads or bracings!

### MAKING YOUR STEP MOBILE

To make your step mobile; stand in front of the steps and pull the central/ side braking lever towards you and fit into the loading lug, by doing this it will engage the front swivel castors on the floor allowing you to manoeuvre the steps into the desired position.

### APPLYING THE CENTRAL / SIDE BRAKING LEVER

Apply the braking lever to allow you to safely ascend the step. To do this, stand in front of the steps and pull the lever towards you slightly, allowing the lever to move out of the lug. Move it back within the brake housing, (this will cause any central levers to move under the steps tread) and will result in the castors lifting, with the front legs grounding.

### APPLYING THE PLUNGER CASTOR BRAKING SYSTEM

To apply the 4 plunger castors ensure that the surface is even. Hold onto the handrails but **do not pull yourself onto the step!** Walk up it making sure your body weight is central to each tread and stand evenly on the platform, as you do this the unit moves to the ground and the castor brake is now active. Descend the step by making sure your body weight is even. Once you're close to the bottom of the unit, the feet will lift back from the floor and the step will be mobile again.

Here at Klime-Ezee we want to ensure our products are safe and easy to use! We always recommend that you seek the advice of your own Health & Safety representative, so that they can conduct their own risk assessment and training based on your requirements for the use of the product. Should you require any more information please do not hesitate to contact us!
